

THE STIX® ADVANTAGE

We're often asked how STIX compares with competitors' software. Here's how you can gain a competitive advantage with STIX!

STIX EHR 9.1 is a CCHIT 08 Certified Electronic Health Record that includes the capacity to track **both** occupational medicine/work comp *and* urgent care and family practice. With a single but differentiated medical record, STIX captures all medical data. Security is rigorously established to differentiate occ med from work comp from personal health information. STIX uses more than a simple check-box to keep these records straight, so you don't lie awake worrying about employers seeing personal health information because someone checked the wrong box.

Rest assured your software is HIPAA compliant. STIX complies fully with all the best practices that have evolved regarding software, so it meets not only the letter, but also the spirit of the law. Audit all records with STIX simple but powerful auditing function.

The EHR includes **coded data in the Patient Chart**, enabling it to be searched and reported. Provider charting data populates the Patient Problems List, as well as the Work Status Summary, and much of the state mandated forms.

Drug Interaction-Checking. STIX includes drug-drug, drug-allergy and drug-disease interaction-verification. The function automatically checks for adverse interactions each time you prescribe, and displays clear warnings. At any time, you can also ask STIX to check for adverse interactions among a patient's current meds.

Electronic prescribing. Send prescriptions directly to the pharmacy, and receive, approve or reject refill requests online.

Verify drug formulary information automatically in real-time and prescribe meds you know are covered.

Dispense meds without your staff having to re-enter patient data into a separate system. STIX is integrated with MDScripts, the most popular dispensing software on the market today. We can work with any prepackager, but our strategic partner, Leader Physician Services, can help ensure you get the best prices. And they will pay the license fees for MDScripts on your behalf.

Clinical Decision Support. STIX offers three types of clinical decision support resources: (1) Treatment and disability duration (ODG, ACOEM, Presley Reed) and fully integrated Elsevier First Consult & MD Consult; (2) Preventive & Wellness guidelines, with automatic alerts for due or overdue items; (3) Disease

Management.

Business Entities (different Tax IDs). STIX is able to distinguish entities with different tax IDs and keep all records according to business entity, all in a single database. This function would enable you to bill on behalf of providers, such as specialists, who see patients at your clinic on a periodic basis.

Rule-based billing instructions. In STIX, simple or complex billing instructions are set up when the account is first established. For example, you may need to bill the lab or a TPA for drug screens, while sending the rest of the visit charges to the employer or carrier; or perhaps the employer wants all post offer physicals on a separate invoice, mailed to a different person or department. A single, structured approach to setting up billing rules and discounts ensures consistency from one user to the next, so that all billing is correct the first time.

Single point data entry. STIX streamlines data entry to avoid entering duplicate data in multiple places. For example, for drug screens, enter results and charges and MRO information all in one place, instead of entering results in one part of the program, MRO data in another and charges in yet another place. For a patient appointment and visit, enter the provider in one place, instead of entering him or her once for the appointment, once again for the injury record and a third time for the treatment plan.

Block out the correct amount of time for an appointment. STIX knows all appointments are not created equal. Just tell STIX what kind of appointment you are scheduling, and it will block out the right amount of provider time for the visit. And if a particular patient needs more or less time, the user can change the duration when the appointment is scheduled.

Submit First Reports with electronic claims. STIX enables you to include the Physicians First Report of Injury (e.g. California 5021) with the claim when submitting claims electronically. No complex workarounds needed!

Interface with other systems in your organization. In 1995, Integritas introduced the Hospital Interface Package, which enables you to easily interface STIX with the following systems, using standard HL7 transactions: Patient Registration and/or MPI, Hospital Billing, Scheduling, Transcription, Lab Results, Radiology Results. The HL7 implementation is capable of being mapped to any vendor system adhering to the latest accepted HL7 Release. No other occupational medicine software vendor offers 15+ years' experience with real-time HL7 interfaces.

Scan through Citrix over a wide area network. Got multiple sites? STIX enables scanning via Citrix because it uses an approach different from other vendors. STIX stores the scanned image right in the STIX database, making access to scanned documents faster and more efficient than other products.

STIX works the way you work - only faster! Take a look at our Merlins ~ a magical charting function that charts faster than a magic wand. Don't get forced through a particular sequence. Work the way that works for you - not just the software.
